Mitigate the Organizational Risks of Using Generative AI

Hi Marianne,

From Bing to Bard to ChatGPT, generative artificial intelligence (AI) is now part of many organizations' strategies to increase efficiency and stay on the bleeding edge of innovation.

Alongside the possibilities of AI is the very real risk of leaking sensitive data like source code or proprietary product information. This webinar will help security teams understand how to take advantage of the potential of AI while reducing risk.

Join Tom Baumgartner, Senior Manager of Cisco Security Service Edge (SSE) Product Marketing, and Nitin Kumar, SSE Technical Marketing Engineering Lead, Cisco Security, on **March 28th at 11 am PT / 2 pm ET**.

We'll cover:

- How to mitigate risks of using generative AI by improving visibility and oversight
- Ways your organization can discover, assess, block, or safely allow generative AI usage
- A demo of how both Cisco Umbrella and Cisco Secure Access support security across 70 (and counting) AI chatbot sites, as well as block unsafe ChatGPT content downloads

Register now to learn how your organization can navigate using ChatGPT and other generative AI tools securely and explore the future of security in the age of AI.
